*In this issue we investigate
Off-Site Services*

The vast majority of our work is completed at your facility in your boiler. However, FMP can apply Green Shield Ceramic Coating to your water wall, economizer and super heat tube panels prior to installation. This can save you valuable time during an outage.

Simply divert your shipment from your supplier to our facilities, where we will apply our Green Shield Ceramic to your tubes and cure the panels in one of the largest industrial furnaces in North America. FMP can also apply Green Shield Ceramic to your new tube panels at your facility, for installation by others at a future date.

FMP will make weld preparation allowances, and provide a team of ceramic technicians to inspect the ceramic and make any touch ups that may be required once the panels have been installed.
